

7. Implement a java program to Demonstrate a swing event handling application that creates 2 buttons Alpha and Beta and displays the text “Alpha pressed” when alpha button is clicked and “Beta pressed” when beta button is clicked.

```
import javax.swing.*;
import java.awt.event.*;

public class SimpleButtonDemo {

    public static void main(String[] args) {

        //Create frame
        JFrame f = new JFrame("Button Demo");
        f.setSize(300, 200);
        f.setLayout(null);

        //Create buttons
        JButton b1 = new JButton("Alpha");
        JButton b2 = new JButton("Beta");

        //Set positions
        b1.setBounds(50, 50, 80, 30);
        b2.setBounds(150, 50, 80, 30);

        //Create label
        JLabel l = new JLabel();
        l.setBounds(80, 100, 150, 30);

        //Add action for Alpha button
        b1.addActionListener(new ActionListener() {
            public void actionPerformed(ActionEvent e) {
                l.setText("Alpha pressed");
            }
        });

        //Add action for Beta button
        b2.addActionListener(new ActionListener() {
            public void actionPerformed(ActionEvent e) {
                l.setText("Beta pressed");
            }
        });

        //Add components to frame
        f.add(b1);
        f.add(b2);
        f.add(l);
    }
}
```

```
//Frame settings  
f.setDefaultCloseOperation(JFrame.EXIT_ON_CLOSE);  
f.setVisible(true);  
}  
}
```
